

NETWORK ANALYZER - MTA36

MTA36 measuring transformers stand out because of their easy installation and the large number of network parameters it can measure. These measurement power meters are designed for the calculation and measurement of the electrical variables, voltage, current, frequency, power, power factor, energy, harmonic components...; of a power distribution network. It is available for both single-phase and three-phase (3P4W) measurement.

Its revolutionary design brings together in the same device the measuring transformer and the network power meter, which together with its communication possibilities create a versatile and easy to install device.
